

# EVICEL®

Solutions for Fibrin Sealant (human) Fibrinogen, Thrombin (human)

---

## Consumer Medicine Information

---

### What is in this leaflet?

This leaflet answers some common questions about EVICEL® Solutions for Fibrin Sealant. It does not contain all of the available information. All medicines have risks and benefits. Your doctor has weighed the risks against the benefits for you by using EVICEL® Solutions for Fibrin Sealant.

It does not take the place of talking to your doctor or pharmacist. If you have any concerns about having this medicine, ask your doctor or pharmacist.

Read this leaflet carefully before you start using this medicine

Keep this leaflet. You may need to read it again.

### What is EVICEL® and what is it used for?

EVICEL® is a Fibrin Sealant which is supplied in Australia as a package containing two separate vials, each containing 1 ml, 2 ml or 5 ml of solution Human Fibrinogen and Human Thrombin, respectively.

An application device and appropriate accessory tips are supplied separately.

EVICEL® is applied during surgical operations to reduce bleeding and oozing during and after the operation. EVICEL® is also used to seal tissues during neurosurgery. It is dripped or sprayed onto cut tissue where it forms a thin layer that seals the tissue and/or stops bleeding.

EVICEL® can also be used in blood vessel surgery, in surgery taking place in the area between the

bowels and the posterior abdominal wall, and in brain surgery.

### How does EVICEL® work?

Fibrinogen is a concentrate of clottable protein and Thrombin is an enzyme that causes clottable protein to coalesce. Thus, when the two components are mixed together they clot instantly.

---

### Before you are given the EVICEL®

#### EVICEL® should not be given to you if

- You are hypersensitive (allergic) to products made from human blood or to any of the other ingredients of EVICEL®. Signs of such reactions include hives, rash, tightness of the chest, wheezing, drop in blood pressure and breathing difficulties. If these symptoms occur, the administration has to be discontinued immediately.
- The expiry date printed on the pack has passed.

#### Take special care with EVICEL®

- When EVICEL® is applied during surgery, the surgeon must ensure that it is only applied onto the surface of tissue. EVICEL® must not be injected into tissue or blood vessels because it would cause clots which could be fatal.
- The use of EVICEL® has not been studied in the following

procedures, and there is therefore no information to show that it would be effective in these procedures:

- controlling bleeding in the stomach or intestines by applying the product through an endoscope (tube)
- sealing the stomach or the bowel in order to avoid leakage of their contents after they have been sutured
- and in spinal procedures.

- Life threatening air or gas embolism has occurred with the use of spray devices employing a pressure regulator to administer EVICEL®. This event appears to be related to the use of the spray device at higher than recommended pressures and/or in close proximity to the tissue surface. To avoid the risk of potentially life threatening air embolism EVICEL® should be sprayed using pressurised CO<sub>2</sub> gas only.
- Nearby areas should be protected to make sure that EVICEL® is only applied onto the surface which is to be treated.
- As with any product containing proteins, allergic type hypersensitivity reactions are possible. Signs of such reactions include hives, rash, tightness of the chest, wheezing, drop in blood pressure and anaphylaxis. If these symptoms occur, the administration has to be discontinued immediately.
- When medicines are made from human blood or plasma, certain measures are put into place to prevent infections being passed

on to patients. These include careful selection of blood and plasma donors to make sure those at risk of carrying infections are excluded, and the testing of each donation and pools of plasma for signs of viruses/infections.

Manufacturers of these products also include steps in the processing of the blood and plasma that can inactivate or remove viruses. Despite these measures, when medicines prepared from human blood or plasma are administered, the possibility of passing on infection cannot be totally excluded. This also applies to any unknown or emerging viruses, or other types of infections. The measures taken in the manufacture of Fibrinogen and Thrombin are considered effective for lipid coated viruses such as human immunodeficiency virus (HIV), hepatitis B virus and hepatitis C virus, and the non-enveloped virus, hepatitis A. The measures taken may be of limited value against parvovirus B19. Parvovirus B19 infection may be serious for pregnant women (foetal infection) and for individuals whose immune system is depressed or who have some types of anaemia (e.g. sickle cell disease or haemolytic anaemia).

The healthcare professionals will record the name and batch number(s) of EVICEL® used in order to trace any possible infection source.

### *You must tell your doctor if you*

- are taking or have recently taken any other medicines, even those not prescribed.
- You must tell your doctor, if you are pregnant, planning to become pregnant or breast feeding.

There is not enough information

available to know whether any particular risks are associated with the use of EVICEL® during pregnancy or whilst breast-feeding. However, since EVICEL® is used during a surgical operation, if you are pregnant or breast-feeding you should discuss the overall risks of the operation with your doctor.

### *Use in Children*

Safety of use in children has not been established.

---

## How EVICEL® is given

The doctor treating you will administer EVICEL® during surgery.

During your operation, your doctor will drip or spray EVICEL® onto raw tissue, using an application device. This device allows equal amounts of the two components of EVICEL® to be administered at the same time, and ensures that they mix evenly, which is important for the sealant to have its optimal effect.

The amount of EVICEL® that will be applied depends on the surface area of tissue to be treated during the operation. It will be dripped onto the tissue in short bursts or sprayed in very small amounts (0.1-0.2 ml), to produce a thin, even layer. If application of a single layer of EVICEL® does not completely stop the bleeding, a second layer may be applied.

### *Case of overdose*

EVICEL® is used only for local application and thus the case of overdose is unlikely to occur.

---

## Side effects

Like all medicines, EVICEL® can have side effects, although not everybody gets them.

EVICEL® is a fibrin sealant. Fibrin sealants in general may, in rare cases (1 to 10 patients in 10,000), cause an allergic reaction. If you experience an allergic reaction you might have one or more of the following symptoms: skin rash, hives or wheals (nettle-rash), tightness of the chest, chills, flushing, headache, low blood pressure, lethargy, nausea, restlessness, increased heart rate, tingling, vomiting, or wheezing. No allergic reactions have so far been reported in patients treated with EVICEL®.

There is also a theoretical possibility that you could develop antibodies to the proteins in EVICEL®, which could potentially interfere with blood clotting.

**If you feel unwell tell your doctor immediately, even if your symptoms are different from those just described.**

**If you notice any side effects not mentioned in this leaflet, please inform your doctor or pharmacist.**

In clinical studies with EVICEL® some undesired events occurred for which a causal relation to the application of EVICEL® could not be excluded. After abdominal surgery, some patients presented with an abscess, and in vascular surgery, some cases of an occluded graft occurred which had to be reoperated.

---

## Product Description

### *What is in EVICEL®?*

The active ingredients are as follows:

- Component 1: Fibrinogen (50 - 90 mg/ml clottable protein)

- Component 2: Thrombin - human (800 - 1200 IU/ml)

Other ingredients are:

- Component 1: arginine hydrochloride, glycine, sodium chloride, sodium citrate, calcium chloride and water for injections.
- Component 2: calcium chloride, human albumin, mannitol, sodium acetate and water for injections.

EVICEL® in Australia is available in the following sizes: 2 ml (2 x 1 ml vials), 4 ml (2 x 2 ml vials) and 10 ml (2 x 5 ml).

### *What EVICEL® looks like and contents of the pack*

EVICEL® is a Human Fibrin Sealant which is supplied in Australia as a package containing two separate vials, each containing 1 ml, 2 ml or 5 ml solution of Human Fibrinogen and Human Thrombin, respectively.

An application device and appropriate accessory tips are supplied separately.

Fibrinogen and Thrombin are packaged together as two vials each containing the same volume (1 ml, 2 ml or 5 ml in Australia) of frozen, sterile solution, which is colourless or yellowish when thawed.

Fibrinogen is a concentrate of clottable protein and Thrombin is an enzyme that causes clottable protein to coalesce. Thus, when the two components are mixed together they clot instantly.

---

### **How to store EVICEL®**

#### **Keep out of the reach and sight of children.**

The vials must be stored in an upright position. Store in freezer at or below - 18°C.

Do not use EVICEL® after the expiry date which is stated on the label as well as on the carton after

EXP. The expiry date refers to the last day of that month.

Keep the vials in the outer carton in order to protect from light. After thawing, unopened vials can be stored at 2-8°C and protected from light, for up to 30 days. Do not refreeze.

The Fibrinogen and Thrombin components are stable at room temperature for up to 24 hours but once drawn up into the application device, they must be used immediately.

---

### **Where can you get more information?**

You can get more information from your doctor or pharmacist.

#### *Name and Address of Sponsor:*
